

Hypergeometric Distribution :

A discrete random variable X is said to have a hypergeometric Distribution if its pmf is given by,

$$f(x) = \begin{cases} \frac{\binom{Np}{x} \binom{Nq}{n-x}}{\binom{N}{n}} & , \quad x=0, \dots, n \quad 0 < p < 1 \\ & p+q=1 \end{cases}$$

otherwise

Note that, $0 \leq x \leq Np, \quad 0 \leq n-x \leq Nq$
 $\Rightarrow n-Nq \leq x \leq n$

$$\Rightarrow \max\{0, n-Nq\} \leq x \leq \min\{Np, n\}$$

We know, $\sum_x \binom{M}{x} \binom{N-M}{n-x} = \binom{N}{n}$

$$\Rightarrow \frac{\sum_x \binom{M}{x} \binom{N-M}{n-x}}{\binom{N}{n}} = 1 \quad (\text{this term will form a pmf})$$

$$\therefore \sum_x \frac{\binom{Np}{x} \binom{N-Np}{n-x}}{\binom{N}{n}} = \sum_x \frac{\binom{Np}{x} \binom{Nq}{n-x}}{\binom{N}{n}} = 1$$

Moments :-

$$E(X)_r = \sum_{x=0}^n (x)_r \frac{\binom{Np}{x} \binom{Nq}{n-x}}{\binom{N}{n}} \quad (\text{factorial moments})$$

$$= \sum_{x=0}^n (x)_r \frac{\frac{(Np)!}{x! (Np-x)!} \binom{Nq}{n-x}}{\binom{N}{n}}$$

$$= \frac{(Np)_r}{(x)_r} \sum_{x=r}^n \frac{\frac{(Np-r)!}{(x-r)! (Np-x)!} \binom{Nq}{n-x}}{\binom{N}{n}}$$

$$= \frac{(Np)_r}{\binom{N}{n}} \sum_{x=r}^n \binom{Np-r}{x-r} \binom{Nq}{n-x}$$

$$= \frac{(Np)_r}{\binom{N}{n}} \sum_{y=x-r=0}^{n-r} \binom{Np-r}{y} \binom{Nq}{n-r-y}$$

$$x_0 = (x-r)_0 = (x)_r$$

$$(Np)_0 = (Np-r)_0 = (Np)_r$$

$C(n, r)$

$$= \frac{(Np)^n}{\binom{N}{n}} \binom{N-n}{n-r} \sum_{y=0}^{n-r} \frac{\binom{Np-r}{y} \binom{Na}{n-r-y}}{\binom{N-n}{n-r}}$$

pmf of hypergeometric
 $\therefore = 1$

$$= \frac{(Np)^n}{\binom{N}{n}} \binom{N-n}{n-r}$$

$$E(X_r) = \frac{(Np)^n}{\binom{N}{n}} \binom{N-n}{n-r}$$

$$r=1, E(X) = \frac{Np}{\binom{N}{n}} \binom{N-1}{n-1} = \frac{Np}{N} \frac{n}{1} \frac{(N-1)!}{(N-n)! (n-1)!} = np$$

$$r=2, E(X_2) = E(X(X-1)) = \frac{Np(Np-1) \frac{n(n-1)}{2} \frac{(N-2)!}{(N-n)! (n-2)!}}{N(N-1)} = \frac{p(Np-1) n(n-1)}{(N-1)}$$

$$\begin{aligned} \text{var}(X) &= E(X^2) - E^2(X) \\ &= E(X(X-1)) + E(X) - E^2(X) \\ &= \frac{p(Np-1)n(n-1)}{(N-1)} + np - n^2p^2 \\ &= \frac{p(Np-1)n(n-1) + np(N-1) - n^2p^2(N-1)}{(N-1)} \\ &= \frac{np}{(N-1)} [(Np-1)(n-1) + (N-1) - np(N-1)] \\ &= \frac{np}{(N-1)} [Np-1-n-Np+1+N-1-npN+np] \\ &= \frac{np}{(N-1)} [(N-n) - p(N-n)] \\ &= \frac{np}{(N-1)} (N-n)(1-p) \\ &= npq \frac{(N-n)}{(N-1)} \end{aligned}$$

Suppose there are N individuals in a population of which Np individuals possess a characteristic A and Na do not possess the characteristic A . Let X be the number of

character A and no do not possess the character A. Let x be the number of individuals with characteristics A in a random sample of size n . Find $P(X=x)$ under the following scheme WR and WOR.

WR (with replacement) :-

X denote the no of individual in the sample who possess the character A.

$P(X=x) = P(x \text{ no of individuals with character A and } (n-x) \text{ with character } A^c \text{ in a random sample of size } n)$

$$= \binom{n}{x} \left(\frac{Np}{N}\right)^x \left(\frac{Nq}{N}\right)^{n-x}$$

\downarrow
A

\downarrow
A^c

WR

$$= \frac{\binom{n}{x} (Np)^x (Nq)^{n-x}}{N^n} = \binom{n}{x} p^x q^{n-x}.$$

$$X \sim \text{Bin}(n, p)$$

WOR (without replacement) :-

$$P(X=x) = \frac{\binom{n}{x} (Np)_x (Nq)_{n-x}}{\binom{N}{n}} \quad (\text{considering ordered sample})$$

$$= \frac{\binom{Np}{x} \binom{Nq}{n-x}}{\binom{N}{n}}$$

$$X \sim \text{Hyp}(n, N, p)$$

Show that, $\frac{\binom{Np}{x} \binom{Nq}{n-x}}{\binom{N}{n}} \xrightarrow{N \rightarrow \infty} \binom{n}{x} p^x q^{n-x}$

$$N \rightarrow \infty, \quad \frac{n}{N} \rightarrow 0,$$

$$\begin{aligned} \frac{\binom{Np}{x} \binom{Nq}{n-x}}{\binom{N}{n}} &= \binom{n}{x} \frac{(Np)_x (Nq)_{n-x}}{(N)_n} \\ &= \binom{n}{x} \frac{Np(Np-1) \dots (Np-x+1) Nq(Nq-1) \dots (Nq-n+x)}{N(N-1)(N-2) \dots (N-n+1)} \\ &= \binom{n}{x} \frac{p(p-\frac{1}{N})(p-\frac{2}{N}) \dots (p-\frac{x-1}{N}) q(q-\frac{1}{N}) \dots (q-\frac{n-x-1}{N})}{1(1-\frac{1}{N})(1-\frac{2}{N}) \dots (1-\frac{n-1}{N})} \\ &= \binom{n}{x} p^x q^{n-x} \end{aligned}$$

as $N \rightarrow \infty$, but $\frac{n}{N} \rightarrow 0$.

Interpretation:

As N tends to infinity, finite population become infinite population. From a p infinite population drawing sample under WOR is practically equivalent to draw sample under WR. As a sample under WR can also be obtained under WOR.

Hence, as N tends to infinity, the distribution of WOR becomes the distribution of WR, \Rightarrow Hypergeometric distribution becomes Binomial distribution.

Remark :

$$E(X_{WR}) = E(X_{WOR}) = np.$$

$$\text{Var}(X_{WR}) = npq > npq \underbrace{\left(\frac{N-n}{N-1}\right)}_{<1} = \text{Var}(X_{WOR})$$

Examples:

The factor in the variance $\left(\frac{N-n}{N-1}\right)$ as a multiplier using due to the use of WOR schemes in a finite population instead of an infinite population. It is known as **FPC**. (Finite population correction)

1. An unknown number of animals inhabit in a certain region. First, catch a number of 'm' of these animals, mark them in some manner and release them. After allowing the marked animals time to dispersed through at the region. A new catch of size 'n' is made. Let X denotes the number of marked animals in the second capture. Find the probability distribution of X. Find $E(X)$ and $\text{var}(X)$.

Let there are total N number of unknown animals.
Out of these m are marked, so, $(N-m)$ are unmarked.

$$P(X=x) = \frac{\binom{m}{x} \binom{N-m}{n-x}}{\binom{N}{n}}, \quad x=0(1)n.$$

$$\therefore X \sim \text{Hypergeometric}(m, N, p)$$

$$E(X) = \frac{nm}{N}, \quad \frac{m}{N} = p$$

$$\text{Var}(X) = npq \left(\frac{N-n}{N-1}\right) = n \frac{m}{N} \left(1 - \frac{m}{N}\right) \left(\frac{N-n}{N-1}\right)$$

2) If $X \sim \text{Hyp}(n, N, p)$, show that $E(n-X)_n = \binom{n}{n} \frac{(Nq)_n}{(N)_n}$

$$X \sim \text{Hyp}(n, N, p)$$

$$Y = n - X \sim \text{Hyp}(n, N, 1-p)$$

$$\begin{aligned} P(Y=y) &= P(n-X=y) = P(X=n-y) \\ &= \frac{\binom{Np}{n-y} \binom{Nq}{y}}{\binom{N}{n}} \\ &= \frac{\binom{Nq}{y} \binom{Np}{n-y}}{\binom{N}{n}} \sim \text{Hyp}(n, N, q) \end{aligned}$$

$$\text{We got, } E(X)_n = \frac{(Np)_n}{\binom{N}{n}} \binom{N-n}{n-n}$$

$$\begin{aligned} E(Y)_n &= E[(n-X)_n] = \frac{(Nq)_n}{\binom{N}{n}} \binom{N-n}{n-n} \\ &= (Nq)_n \frac{(N-n)!}{(n-n)! (N-n)!} \frac{n! (N-n)!}{N!} \\ &= (Nq)_n \frac{(n)_n}{(N)_n} \end{aligned}$$

3) $X \sim \text{Hyp}(n, N, m)$, show that $E(x^k) = \frac{nm}{N} E(Y+1)^{k-1}$,
where, $Y \sim \text{Hyp}(n-1, N-1, m-1)$. Find $E(x)$, $\text{var}(x)$

$$X \sim \text{Hyp}(n, N, m)$$

$$\begin{aligned} E(X^k) &= \sum_{x=0}^n x^k \frac{\binom{m}{x} \binom{N-m}{n-x}}{\binom{N}{n}} \\ &= \sum_{x=0}^n x^{k-1} \frac{\binom{m-1}{x-1} m \binom{N-m}{n-x}}{\binom{N}{n}} \\ &= \sum_{x=1}^n x^{k-1} m \binom{m-1}{x-1} \frac{\binom{(N-1)-(m-1)}{(n-1)-(x-1)}}{\frac{N}{n} \binom{N-1}{n-1}} \\ &= \sum_{x-1=y=0}^n (y+1)^{k-1} \frac{\binom{m-1}{y} \binom{N-1-y}{n-1-y}}{\binom{N-1}{n-1}} \frac{nm}{N} \end{aligned}$$

$$= \frac{n(n-1)}{N} E(Y+1)$$

$$Y \sim \text{Hyp}(n-1, N-1, m-1)$$

$$k=1, E(X) = \frac{nm}{N} \quad E(Y+1) = \frac{nm}{N}$$

$$\begin{aligned} k=2, E(X^2) &= \frac{nm}{N} E(Y+1) = \frac{nm}{N} \left[\frac{(n-1)(m-1)}{(N-1)} + 1 \right] \\ &= \frac{nm}{N} \left(\frac{nm-m-n}{N-1} \right) \end{aligned}$$

$$\begin{aligned} v(X) &= E(X^2) - E^2(X) \\ &= \frac{nm}{N} \left(\frac{nm-m-n}{N-1} \right) - \frac{n^2 m^2}{N^2} \\ &= \frac{nm}{N} \frac{(N-m)(N-n)}{N(N-1)} \end{aligned}$$

4) Let X_1, \dots, X_n be n independent Bernoulli(p) RV. Let $S_j = \sum_{i=1}^j X_i$ where $j=1(1)n$. Show that, $P(S_m=r | S_n=s)$ does not depend on p , where $m < n$. Identify the distribution and obtain first two moments of it.

$$X_1, X_2, \dots, X_n \stackrel{\text{iid}}{\sim} \text{Bern}(p)$$

$$S_j = \sum_{i=1}^j X_i \sim \text{Bin}(j, p), \quad j=1(1)n.$$

$$S_m = \sum_{i=1}^m X_i \sim \text{Bin}(m, p).$$

$$S_n = \sum_{i=1}^n X_i \sim \text{Bin}(n, p)$$

$$\begin{cases} S_n = X_1 + \dots + X_m + X_{m+1} + \dots + X_n \\ S_m = X_1 + \dots + X_m \end{cases} \quad n > m$$

$$S_n - S_m = \sum_{i=m+1}^n X_i \sim \text{Bin}(n-m, p)$$

$$P(S_m=r | S_n=s) = \frac{P(S_m=r, S_n=s)}{P(S_n=s)}$$

$$= \frac{P(S_m=r, S_n-S_m=s-r)}{P(S_n=s)}$$

$$= \frac{P(S_m=r) P(S_n-S_m=s-r)}{P(S_n=s)}$$

$$= \frac{\binom{m}{r} p^r q^{m-r} \binom{n-m}{s-r} p^{s-r} q^{n-m-s+r}}{\binom{n}{s} p^s q^{n-s}}$$

$$\binom{n}{s} p^s q^{n-s}$$

$$= \frac{\binom{m}{s} \binom{n-m}{s-s}}{\binom{n}{s}}, \quad p = o(1)s.$$

$$E(x) = \frac{sm}{n}$$

$$\text{var}(x) = s \frac{m}{n} \left(1 - \frac{m}{n}\right) \left(\frac{n-s}{n-1}\right)$$

5) Mode of Hypergeometric Distribution :-

$$\text{pmf, } f(x) = \frac{\binom{Np}{x} \binom{Nq}{n-x}}{\binom{N}{n}}, \quad x = 0, 1, \dots, n$$

$$\begin{aligned} \text{Note that, } \frac{f(x)}{f(x-1)} &= \frac{\binom{Np}{x} \binom{Nq}{n-x}}{\binom{N}{n}} \cdot \frac{\binom{N}{n}}{\binom{Np}{x-1} \binom{Nq}{n-x+1}} \\ &= \frac{\cancel{Np!} \cancel{(Nq)!} (Nq-n+x-1)! (n-x+1)! (Np-x+1)!}{x! (Np-x)! (n-x)! (Nq-n+x)! \cancel{Np!} \cancel{(Nq)!}} \\ &= \frac{(Np-x+1)(n-x+1)}{(Nq-n+x)x} \geq 1 \text{ if } \\ &\quad x \leq \frac{(n+1)(Np+1)}{(N+2)} \end{aligned}$$

Case I -

$$\frac{(n+1)(Np+1)}{(N+2)} \text{ is not an integer,}$$

$$\text{let } \left\lfloor \frac{(n+1)(Np+1)}{(N+2)} \right\rfloor = k$$

$$\frac{f(1)}{f(0)} > 1, \frac{f(2)}{f(1)} > 1, \dots, \frac{f(k)}{f(k-1)} > 1, \dots, \frac{f(k+1)}{f(k)} < 1, \dots$$

$$\Rightarrow f(0) < f(1) < f(2) < \dots < f(k-1) < f(k) > f(k+1) > \dots$$

Clearly, $f(k)$ is the maximum.

$$\therefore k = \left\lfloor \frac{(n+1)(Np+1)}{(N+2)} \right\rfloor \text{ is the mode.}$$

Case II :-

$$k = \frac{(n+1)(Np+1)}{(N+2)} \text{ is an integer.}$$

$$\frac{f(1)}{f(0)} > 1, \frac{f(2)}{f(1)} > 1, \dots, \frac{f(k)}{f(k-1)} = 1, \frac{f(k+1)}{f(k)} < 1, \dots$$

$$f(0) \quad f(1) \quad f(2) \quad \dots \quad f(k-1) \quad f(k) \quad f(k+1) \quad f(k+2) \quad \dots$$

$$f(0) < f(1) < f(2) < \dots < f(k-1) = f(k) > f(k+1) > f(k+2) > \dots$$

clearly, $f(k-1)$ and $f(k)$ is the maximum,

Hence, $k, & (k-1) = \frac{(n+1)(N+1)}{(N+2)}$ are the mode.
